

Save time on tyre pressure-checks with Hamaton's NEW "DSV" Double-Seal Valve Cap

DSV
DOUBLE SEAL VALVE CAP

Market-leading manufacturer of valves, tyre inflation products and TPMS solutions, Hamaton, have announced the launch of their new Double Seal Valve Cap. The "DSV" cap is designed to replace standard valve caps on truck and heavy-duty vehicle wheels, enabling tyre pressure to be checked and inflation to be achieved directly through the valve cap. The valve seals in the same way as a high-pressure valve cap, yet offers the convenience and simplicity of an inflate-through extension, as there is no need for the valve caps to be removed at any time.

Benefits of the DSV cap:

- Significantly reduces pressure check times, minimising standstill periods and unnecessary costs
- Sealed valve cap protects the valve core from dirt and water, preventing corrosion and increasing its lifespan
- As the valve cap does not have to be removed, it cannot be lost or forgotten during air pressure checks – saving additional costs and improving safety

DSV: 2-706
